6. The system of claim 4, wherein said first switching point routes calls originally directed to said first telephone station, to the first telephone station based upon said routing information.

7. The system of claim 4, wherein said first switching point routes calls originally directed to said first telephone station, to the second telephone station based upon said routing information.

8. The system of claim 5, wherein said second switching point charges calls originating from said second telephone station to the second telephone station based upon said billing information.

9. The system of claim 5, wherein said second switching point charges calls originating from said second telephone station to the first telephone station based upon said billing information.

10. The system of claim 1, wherein said database in said service control point further comprises notification information identifying a distinctive ringing pattern for calls originally directed to said first telephone station but which are re-routed to said second telephone station.

11. The system of claim 10, wherein said first switching point causes calls which were originally directed to said first telephone station and which are rerouted to said second telephone station based upon said routing information, to have a distinctive ring at said second telephone station.

12. A system for managing calls in a telephone network, comprising:
a first service switching point communicating with a first telephone station;

a second service switching point communicating with a second telephone station;
and

a service control point communicating with said first service control point and said second service control point, said service control point having a database including information specifying where to rout calls and information specifying to which number a calls should be billed,

wherein upon receipt of a call destined for said first telephone station, said first service switching point polls said service control point for information specifying where to route the call destined for said first telephone station, and routes the call to either said first telephone station or said second telephone station based upon the information from said service control point, and

wherein upon receipt of a call originating from said second telephone station, said second service switching point polls said service control point for information specifying to which service station the call is to be billed, and bills the call to either said first telephone station or said second telephone station based upon the information from said service control point.

13. In an advanced intelligent network comprising a first service switching point communicating with a first telephone station, a second service switching point communicating with a second telephone station, and a service control point communicating with said first service switching point and said second service switching point, and containing a database that receives routing information for specifying routing of calls directed to the first telephone station, billing information for specifying billing of calls placed from the second telephone station, and notification information for identifying a ringing pattern, a method of managing telephone calls, comprising:

at the first service switching point, forwarding a request for routing information to the service control point;

at the service control point, forwarding routing information to the first service switching point;

at the first service switching point, routing a call originally directed to the first telephone station based upon the routing information;

at the second service switching point, forwarding a request for billing information to the service control point;

at the service control point, forwarding billing information to the second service switching point;

at the second service switching point, billing a call received from the second telephone station based upon the billing information.

14. The method of claim 13, further comprising the following acts:

at the first service switching point, forwarding a request for notification information to the service control point;

at the service control point, forwarding notification information to the first service switching point;

at the first service switching point, assigning a distinctive ringing pattern to a call originally directed to the first telephone station and which is rerouted to the second telephone station.

15. The method of claim 13, wherein said routing information indicates whether an incoming call originally directed to the first telephone station is to be forwarded to the first telephone station or to the second telephone station.

16. The method of claim 13, wherein the act of routing a call originally directed to the first telephone station based upon the routing information, comprises routing a call to the first telephone station.

17. The method of claim 13, wherein the act of routing a call originally directed to the first telephone station based upon the routing information, comprises routing a call to the second telephone station.

18. The method of claim 13, wherein the billing information identifies whether a call placed from the second telephone station is to be charged to the second telephone station or the first telephone station.

19. The method of claim 13, wherein the act of charging a call received from the second telephone station based upon the billing information comprises billing a call to the second telephone station.

20. The method of claim 13, wherein the act of charging a call received from the second telephone station based upon the billing information comprises billing a call to the first telephone station.

21. The method of claim 13, further comprising the following acts:
at the first service switching point, forwarding a request for notification information to the service control point;
at the service control point, forwarding notification information to the first service switching point; and
at the first service switching point, assigning a distinctive ringing pattern to a call originally directed to the first telephone station and which is rerouted to the second telephone station.

22. A method of managing calls in a telephone network, comprising:

upon receiving a call directed to a first telephone station, polling a service control point for information specifying whether to forward the call to the first telephone station or to a second telephone station;

forwarding the call to either the first telephone station or the second telephone station as specified by the information from the service control point; and

upon receiving a call originating at a second telephone station, polling a service control point for information specifying whether to charge the call to the second telephone station or the second telephone station.
